

# **ZXDiagram**

**NEW IN 13.2** 

```
ZXDiagram [\{expr_1, expr_2, ...\}]
```

constructs a ZX diagram from ZX expressions  $expr_1$ ,  $expr_2$ , ... and stores it as ZXObject.

 $ZXDiagram [obj_1, obj_2, ..., \{expr_1, expr_2, ...\}]$ 

constructs a ZX diagram on top of the existing ZXObjects  $obj_1, obj_2, ...$ 

# → Details and Options

- $\begin{tabular}{ll} & \textbf{Valid ZX expressions include Z[$k_1$, $k_2$, ...][$phase$] for the Z spiders, X[$k_1$, $k_2$, ...][$phase$] for the X spiders, H[$k_1$, $k_2$, ...] for the Hadamard gates, B[$k_1$, $k_2$, ...] for the Hadamard gates, B[$ diamond gates.
- The links between spiders take form  $Z[i_1, i_2, ...][phase] \rightarrow Z[k_1, k_2, ...][phase], Z[i_1, i_2, ...][phase] \rightarrow X[k_1, k_2, ...][phase], X[i_1, i_2, ...][phase], X[i$  $X[i_1, i_2, ...][phase] \rightarrow X[k_1, k_2, ...][phase]$ . The phase part [phase] in spider specifications may be dropped if the same spider appears with a phase value somewhere in the ZX expression.
- The Hadamard gates may also be involved in ZX links. However, it can one and only one incoming and outgoing link.
- To generate ZX links, Q3 function Chain may be useful.
- Within ZXDiagram, Rule [→], is regarded as Chain. This simplifies the DirectedEdge specifications in a ZX expression. For example, a→b→c→... is equivalent to Chain [a, b, c, ...], which generates a series of DirectedEdges  $\{a \rightarrow b, b \rightarrow c, c \rightarrow ...\}$ .

### **▼** Examples (22)

In[1]:= Needs["MaZX`"]

### → Basic Examples (7)

Here is a simple example of ZX diagram. Note that how specifying DirectedEdges have been simplified by using Chain.

In[1]:= ZXDiagram[{Chain[i, Z[1][Pi/2], X[1][Pi], o]}]

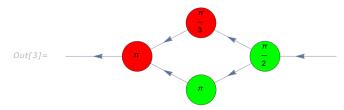

Specifying the ZX links may be simplified even further by using  $a \rightarrow b \rightarrow c \rightarrow ...$  Note that this works only within ZXDiagram.

$$In[2]:= ZXDiagram[\{i \rightarrow Z[1][Pi/2] \rightarrow X[1][Pi] \rightarrow o\}]$$

$$Out[2]= \frac{\pi}{2}$$

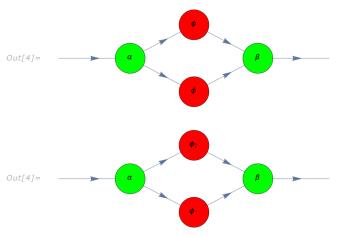

Using  $\dots \to \{a, b\} \to \dots = \{\dots \to a \to \dots, \dots \to b \to \dots\}$  is another method for simplifying your specifications.

 $In[3]:= ZXDiagram[{i \rightarrow Z[1][Pi/2] \rightarrow {Z[2][Pi], X[2][Pi/3]} \rightarrow X[1][Pi] \rightarrow o},$ GraphLayout -> "SpringElectricalEmbedding"]

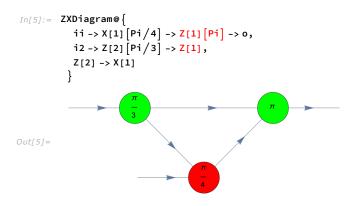

Here is another shortcut: Within ZXDiagram,  $X[\{k_1, k_2, ..., k_n\}][\phi]$  is expanded to  $\{X[k_1][\phi], X[k_2][\phi], ..., X[k_n][\phi]\}.$  Similarly,  $X[\{k_1, k_2, ..., k_n\}][\{\phi_1, \phi_2, ..., \phi_n\}] = \{X[k_1][\phi_1], ..., X[k_n][\phi_n]\}.$  Note that this is only the case within ZXDiagram.

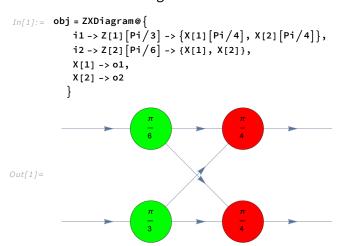

In[4]:= ZXDiagram[ $\{i \rightarrow Z[1][\alpha] \rightarrow X[\{1, 2\}][\phi] \rightarrow Z[2][\beta] \rightarrow 0\}$ , GraphLayout  $\rightarrow$  "SpringElectricalEmbedding"]  $ZXDiagram \Big[ \Big\{ i \rightarrow Z[1][\alpha] \rightarrow X[\{1,\ 2\}][\{\phi_1,\ \phi_2\}] \rightarrow Z[2][\beta] \rightarrow o \Big\}, \ GraphLayout \rightarrow "SpringElectricalEmbedding" \Big] \Big\}$ 

Here, note that the second Z spider does not have a phase specification. This is because the phase value  $\pi$  must be clear from the previous specification  $z_{[1][Pi]}$  of the same spider.

In a ZX expression, the Hadamard gate can have one and only one input and output links.

**ZXDiagram:** Wrong arities for some Hadamard gates:  $\{H_1 \rightarrow \{2, 2\}\}$ . Every Hadamard gate should have one and only one input and output link.

### **◆** Combining two ZXObjects (3)

# Here is one ZX diagram.

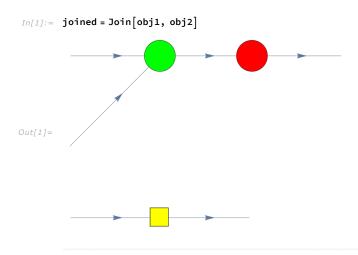

$$\begin{array}{lll} \textit{Out[1]=} & (-1)^{1/3} \; \left| 0_o \right\rangle \left\langle 1_{11} 1_{12} \right| \; + \; \left| 1_o \right\rangle \left\langle 0_{11} 0_{12} \right| \\ \\ \textit{Out[1]//MatrixForm=} \\ & \left( \begin{array}{ccc} 0 & 0 & e^{\frac{i \, \pi}{3}} \\ 1 & 0 & 0 & 0 \end{array} \right) \end{array}$$

Here is another one.

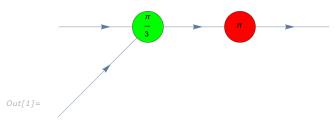

If you want to combine the above two ZX diagrams, usually, you have to put all those ZX expression in the above two diagrams again in the new one.

$$In[3] := \begin{array}{c} \text{new = ZXDiagrame} \left\{ \begin{array}{c} \{i1,\ i2\} \rightarrow \text{Z[1]} [\text{Pi}/3] \rightarrow \text{X[1]} [\text{Pi}] \rightarrow \text{o}, \\ i3 \rightarrow \text{H[1]} \rightarrow \text{o2} \end{array} \right\} \\ \text{op = ExpressionFor [new]} \\ \\ Out[3] = \begin{array}{c} \frac{(-1)^{1/3} \left| \Theta_0 \Theta_{02} \right\rangle \left\langle 1_{11} 1_{12} \Theta_{13} \right|}{\sqrt{2}} + \frac{(-1)^{1/3} \left| \Theta_0 \Theta_{02} \right\rangle \left\langle 1_{11} 1_{12} 1_{13} \right|}{\sqrt{2}} + \frac{(-1)^{1/3} \left| \Theta_0 \Theta_{02} \right\rangle \left\langle 1_{11} 1_{12} \Theta_{13} \right|}{\sqrt{2}} - \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} \Theta_{13} \right|}{\sqrt{2}} + \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} \Theta_{13} \right|}{\sqrt{2}} + \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} 1_{13} \right|}{\sqrt{2}} + \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} 1_{13} \right|}{\sqrt{2}} + \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} 1_{13} \right|}{\sqrt{2}} + \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} 1_{13} \right|}{\sqrt{2}} - \frac{\left| 1_0 \Theta_{02} \right\rangle \left\langle \Theta_{11} \Theta_{12} 1_{13} \right|}{\sqrt{2}} \end{array}$$

To avoid, you can just combine them using Join.

If you just add to an already existing ZX diagram, then just include the previous one in the ZX expression.
